Managed Multisite Deployments
Take Control of Enterprise-Wide IT

TOP FIVE

Top Five Challenges of Global IT Deployments

For IT professionals, the pressure is on. Digital transformation has become a critical business objective. But more than 70% of digital transformation projects fail. Why? Delivering new technology is a tough job that demands resources, skills, and budgets that IT teams simply don't have, especially in dispersed enterprises with little or no remote IT staff.

Are You Facing These Challenges?

1. Insufficient IT Budget and Resources

This is one of the most pervasive challenges in IT. In a study of IT leaders, 45% reported they lacked a sufficient budget. Concurrent with this is the lack of IT resources. A Gartner study indicates that 42% of CIOs are concerned that they are missing the expertise for digital transformation so 51% are outsourcing IT to some extent and 35% to a great extent. As a Global Systems Integrator, we have the expertise and scale to deploy new technologies at one site or hundreds of sites around the globe.

2. Security/Privacy Concerns

Security and privacy are top concerns in the adoption of new technology according to 33% of IT leaders. Organizations need to weigh the benefits and risks involved to protect data and personal information. We can help you evaluate new technologies and decide what solution is best for you.

3. Speed and Timeliness

According to a survey of IT leaders, 31% cite the ability to deliver new technologies in a timely manner as a top priority. This is especially true in dispersed enterprises where the challenge of digital transformation is compounded exponentially. We solve this problem with a global team and a rapid, streamlined deployment model that has included hundreds of sites per night.

4. System Integration

This is a critical business objective for IT leaders. But some studies show that as many as 70% of projects fail due to the lack of understanding of the project complexity, skilled resources, and poor management. Our mission is to ensure current functionality and interoperability, improve the flow of information, reduce operational costs, and prepare for future performance.

5. Legacy Technology

How do you manage a system that is out of support, requires constant maintenance, and doesn't enable digital transformation? And how do you migrate to a modern system without disruption to users, customers, workflows, and data? Fortunately, we have experience in both areas: knowledge of legacy technology and expertise in smooth, timely migrations.

As a Global Systems Integrator, our goal is to complement your IT team and accelerate your digital transformation by eliminating the many challenges of multisite IT deployments. Our team of experts, along with our global resources and time-tested methodology, will deploy new technology at one or many sites with professionalism, speed, and consistency.
