

5

Things Every Mobile-First  
Strategy Needs

A mobile-first strategy is more than creating a network that supports all required wireless technology; it's the cornerstone of any future-ready IT roadmap. Our checklist identifies the five key elements necessary to create a future-ready mobility strategy today.

1

#### **Enable Mission-Critical Performance With Capacity**

The best way to keep wireless technology running at full bandwidth is by leveraging capacity-oriented and best-network, best-device designs. A single type of wireless technology is not enough to drive superior experiences at the intelligent digital edge.

2

#### **Be Uniform Across The Enterprise**

IT architecture has to be customised to each building or building type while allowing for consistent experiences from HQ to branch to manufacturing to warehouse.

3

#### **Managed Long Term**

Devices and applications continue to increase in numbers every year. With the right managed solution, you won't need to worry about maintenance, upgrades, secure connectivity to internet and WAN services, and security requirements that need your constant attention.

4

#### **Foundational Technology**

Start by building the right foundation with structured cabling – both fibre and CATx copper cabling – and internet connectivity. Combining the infrastructure with built-in network security and analytics provides better user-experiences, assists with timely business decisions and may even prevent threats before they happen.

5

#### **A Trusted Partner at The Intelligent Digital Edge**

We give your enterprise one partner to design and deploy your mobile-first strategy with consistency and at scale. And, we'll be there to make sure your solution continues to provide optimal performance

**Contact a Black Box representative today to design, deploy and manage a mobility solution that enables your digital transformation plans.**

Black Box takes into account your network problems, devices and digital transformation plans to design a solution that moves and grows with you. We consistently deliver seamless integration of Wi-Fi technologies that can uniquely accommodate Wi-Fi, public safety, 2-way and paging into your comprehensive wireless solution. For many organisations, business operations demand a partner capable of addressing every in-building wireless need across every building in your enterprise with consistency — from large and complex, high-traffic environments to small, highly distributed multi-site scenarios. With Black Box, you have a trusted digital transformation partner that will help you design, deploy, and manage a robust mobility solution.
