

## What is Wi-Fi as a Service?

Wi-Fi as a Service (WaaS) is a subscription-based service that combines three key elements: infrastructure, software, and managed services.

### Infrastructure

All of the hardware and equipment, from access points to firewalls.

### Software

Centralized network management with real-time visibility, a customized portal, business intelligence options, location-services and reporting.

### Managed Services

24/7 remote monitoring and troubleshooting of configuration issues, executive dashboards with weekly/monthly reporting.

**With WaaS, we have packaged virtually every aspect of a high-performing, secure Wi-Fi network into one end-to-end solution.**

- **24 X 7 X 365:** Cloud-managed Wi-Fi: through cloud-based dashboard we monitor and manage your network.
- **Real-Time Status and Baseline Comparisons:** View exactly what is going on with your network, from current status to trends over time, to help you determine plans and budget for the future.
- **Scalability:** We grow with you at your pace.
- **Bandwidth Management:** Together, we develop and implement bandwidth usage policies to make the best use of your available bandwidth to improve the experience for all your guests.
- **Wi-Fi Assurance:** Automated wireless operations make Wi-Fi predictable, reliable, and measurable and provides unique visibility into user service levels. (Track capacity, coverage, and throughput)
- **Customizable Wi-Fi Service Levels:** Set, monitor, and enforce service-level expectations for key performance metrics.
- **Advanced Threat Prevention:** A virtual threat intelligence hub for your network, available as a cloud service or an on-premises application. Protect against known and unknown threats, assess and verify device and IoT risk, and analyze encrypted traffic.

**A Comprehensive Package. We've Thought of Everything So You Don't Have To.**
